Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-! FUNCTION: CHEMOATTRACTANT FOR BLOOD MONOCYTES, MEMORY T HELPER
CELLS AND EOSINOPHILS. CAUSES THE RELEASE OF HISTAMINE FROM
BASOPHILS AND ACTIVATES EOSINOPHILS.

-! SUBCELLULAR LOCATION: Secreted.

-! SUBCELLULAR LOCATION: T-CELL AND MACROPHAGE SPECIFIC.

-! TISSUE SPECIFICITY: T-CELL AND MACROPHAGE SPECIFIC.

US-60-487-610-1667

Sequence 1667, Application US/60487610

GENERAL INFORMATION:

APPLICANT: CARGILL, Michele

APPLICANT: HUANG, Hongjin

TITLE OF INVENTION: GENETIC POLYMORPHISMS ASSOCIATED WITH

TITLE OF INVENTION: METHODS OF DETECTION AND USES THEREOF

TITLE REFERENCE: CL001469

CURRENT APPLICATION NUMBER: US/60/487,610

CURRENT FILING DATE: 2003-07-17

NUMBER OF SEQ ID NOS: 97101

SOFTWARE: FASESEQ for Windows Version 4.0

LENGTH: 72
                                                                                                                                                                                                                                                                                                                                                                                                                    Length 68;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      72;

Sequence 5, Application US/10398457
GENERAL INFORMATION:
APPLICANT: APPLIED RESEARCH SYSTEMS ARS HOLDING N.V.
TITLE OF INVENTION: CHEMOKINES MUTANTS IN THE TREATMENT OF MULTIPLE SCLEROSIS FILE REFERENCE: WO465
CURRENT APPLICATION NUMBER: US/10/398,457
CURRENT FILING DATE: 2003-11-13
NUMBER OF SEQ ID NOS: 37
SOFTWARE: Patentin version 3.0
APPLICANT: CHANG, Sheng-Yung
TITLE OF INVENTION: GENETIC POLYMORPHISMS ASSOCIATED WITH
TITLE OF INVENTION: RESPONSE TO INTERFERON TREATMENT IN HEPATITIS C
TITLE OF INVENTION: VIRUS-INFECTED SUBJECTS, METHODS OF DETECTION AND USES
TITLE OF INVENTION: THEREOF
FILE REFERENCE: CL001470
CURRENT APPLICATION NUMBER: US/60/485,450
CURRENT APPLICATION NUMBER: US/60/485,450
NUMBER OF SEQ ID NOS: 47859
SOFTWARE: FastSEQ for Windows Version 4.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ACT-US03-28745-3

PCT-US03-28745-3

Sequence 3, Application PC/TUS0328745

GENERAL INFORMATION:

APPLICANT: CHEMOKINE THERAPEUTICS CORP.

TITLE OF INVENTION: DESIGN OF CHEMOKINE ANALOGS FOR THE TREATMENT OF IT THE OF INVENTION NUMBER: PCT/US03/28745

CURRENT FILING DATE: 2003-09-11

NUMBER OF SEQ ID NOS: 1640

SOFTWARE: Patentin version 3.2

SEQ ID NO 3

LENGTH: 69

TYPE: PRT

ORGANISM: Artificial Sequence

The protein was produced by cloning into the expression vector
PYMIP300. The human MIP-lalpha sequence was derived from the
lambda gt10 cDNA clone hMIP1-13a, and the GAPDH promoter sequence,
alpha factor transcription terminator derived from plasmid pGAI1,
the construction of which is described in patent application

EP0324-274. Recombinantly produced MIP proteins have diagnostic and
therapeutic utility for detecting and treating infections, cancer,
myelopoietic dysfunction and autoimmune diseases. Although not
directly cytotoxic for WEH1 tumor cells, MIP-1 treated macrophages
chibited enhanced antibody-independent macrophage cytotoxicity for
tumour targets. MIP-1 treatment stimulated proliferation of mature
tissue macrophages; this effect was synergistic with both CSF-1 and
GM-CSF. Purified preparations of the recombinantly derived
MIP-lalpha peptide alone induced TNF and IL-6 in macrophages, but
MIP-lalpha peptide alone induced TNF and IL-6 in macrophages.
TNF-inducton by MIP-lapha to a significant degree. Other
bloactivity defined for native MIP-1 and recombinant MIP-lalpha
                                                                                                                                                                                                                                                                                                      1 MKLCVTVLSLLMLVAAFCSPALSAPMGSDPPTACCFSYTARKLPRNFVVDYYETSSLCSQ

Most are prepared by reverse transcription of mRNA from activated huma leukocytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.

from HUMACT2A. This sequence a number of the production of a construct from HUMACT2A. This sequence is used in the production of a construct comprising an isolated polynucleotide encoding a chimeric polypeptide which comprises at least 1 chemokine polypeptide covalently attached to at least 1 heterologous polypeptide. By including a heterologous protein in the construction, the chimeric polypeptides will have longer and increased biological activity and can direct the chemokine to a particular site. The chimeric polypeptides can also be designed to inhibit or desensitise chemokine receptors. They can be used to affect inhibiting angiogenesis, for regeneration of bone, cartilage, ligament or tendon, for recruiting inflammatory or autoimmune disorders. They can also be used as vaccine adjuvants or to enhance the activity of antigen presenting cells and for treating or preventing HIV infection.

Neutralising antibodies binding to the chimeric polypeptide may also be useful therapeutics for both conditions associated with the chemokine corresponding to the chemokine domain of the chimeric polypeptide and also in the treatment of some forms of cancer where abnormal expression of the chimeric colling and complete the conditions associated with the chemokine corresponding to the chemokine domain of the chimeric polypeptide and content where abnormal expression

This sequence represents a human beta chemokine, Act-2 which is used to describe a method in which a novel beta chemokine, ZCHEMO-8 is isolated. Altered levels of ZCHEMO-8 may be indicative of pathological conditions, including infections, cancer, myelopoietic disorders, autoimmune including infections, cancer, myelopoietic disorders, autoimmune calculated infections, cancer, myelopoietic disorders, autoimmune calculated in including infections. The ZCHEMO-8 polypeptides can be used, or or reduce the damage in ischaemic and reperfusion injuries, in a wound healing regime to stimulate an infiltration of immune cells (e.g. monocytes, neutrophils, T lymphocytes or basophils) to a wound site to facilitate healing. ZCHEMO may be used to mobilise progenitor cells from the marrow into the peripheral blood for transplants. ZCHEMO-8 polypeptides could be used to further define the role of chemokines in mediating suppression of HIV replication in CD4+ T-cells and limiting progression of HIV infection to AIDS. Use may be made of ZCHEMO-8 antagonists may have a beneficial therapeutic effect in diseases where the inhibition of activation of certain macrophages, neutrophils, basophils, Blymphocytes and/or T cells may be effective. Such diseases include autoimmune diseases e.g. multiple sclerosis, insulin-dependent diabetes and systemic lupus erythematosus, rheumatoid arthritis, allergies, asthma or arteriosclerosis. Also benefit may be derived from using ZCHEMO-8 antagonists for chronic inflammatory and infective diseases. Antagonists may be used to dampen or inactivate and infective diseases. Antagonists may be used to dampen or inactivate and infective diseases. The products can also be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         autoimmune diseases, atherosclerosis, osteoporosis, HIV infection and AIDS, psoriasis, inflammatory diseases, hypertension, basophil-mediated diseases, endotoxaemia, myocardial infarction, acute ischaemia and rheumatoid arthritis, and can be used to prevent strokes and as contraceptives. The coding sequences for the chemokines can be used in gene therapy for the same diseases, as well as in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention concerns the identification of a number of chemokines which can be used to produce derivatives, agonists and antagonists which are then useful in disease treatment. The chemokines include sequences AABIS785-BIS794, AABIS803-BIS813 and AABIS831-BIS848 These chemokine derivatives can be used to treat diseases such as

The inventio discloses a method for identifying selenoprotein coding sequences, detecting certain viruses (e.g. HIV or Ebola), cancer and immune sy disorders. The present sequence was used to illustrate the inventio

```
The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chemokine, MIP-lbeta, chimeric, human, heterologous protein, inhibitor, receptor, chemotaxis, migratory cell, angiogenesis, bone, regeneration, cartilage, ligament, tendon, bone marrow, transplant, inflammation, autoimmune disorder, vaccine adjuvant, antigen presenting cell, cancer, HIV, human immunodeficiency virus, therapy, prevention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                 This sequence represents a human chemokine MIP-1beta domain, isolated from cDNA clone MPB-X. This sequence is used in the production of a construct comprising an isolated polynucleotide encoding a chimeric polypeptide which comprises at least 1 chemokine polypeptide covalently attached to at least 1 heterologous polypeptide. By including a charached to at least 1 heterologous polypeptide. By including a chemokine construction, the chimeric polypeptides will have longer and increased biological activity and can direct the chemokine to a particular site. The chimeric polypeptides can also be designed to inhibit or desensitise to migratory cells, e.g. for to affect the chemotactic recruitment of migratory cells, e.g. for stimulating or inhibiting angiogenesis, for regeneration of bone, cartilage, ligament or tendon, for recruiting transplanted bone marrow cells to bone marrow, or for treating or preventing inflammatory or autoimmune disorders. They can also be used as vaccine adjuvants or to enhance the activity of antigen presenting cells and for treating or centained with the chemokine corresponding to the chimeric polypeptide and also in the treatment of some forms of the chimeric polypeptide and also in the treatment of some forms of the chimeric polypeptide and also in the treatment of some forms of the chimeric polypeptide.

pathene, and for resultable conditions, and for resultable conditions, and for resultable conditions and process and process to hypoxia conditions, reperfusion injury, for monitoring the therapeutic treatment of a disease or physiology, condition, such as cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, preeclapmsia, atherosclerosis, inflammatory retinopathy, neonatal stress, preeclapmsia, erythropoiesis or hair loss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to methods for identifying genes and proteins that are implicated in a specific disease or physiological condition. The method comprises comparing the transcriptome/proteome of a specialised cell type implicated in a disease or condition with that of a second specialised cell type, under two experimental conditions, and identifying a gene that is differentially regulated in the two specialised cell types under experimental conditions. ABV77873-ABV78116 and ABP65061-ABP65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia-regulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                              The present invention relates to selenoproteins encoded in the genoa virus, where the coding sequence of the selenoprotein is genetica engineered for expression in a nucleic acid construct. The inventio discloses a method for identifying selenoprotein coding sequences, detecting certain viruses (e.g. HIV or Ebola), cancer and immune sy disorders. The present sequence was used to illustrate the inventio

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the isolation of novel human polypeptides referred to as NOVX (NOV1-NOV44), variants of these proteins, and the polynucleotide sequences encoding them. The NOVX proteins of the invention are G-protein coupled receptor (GPCR) related proteins. The sequences of the invention are useful in the manufacture of a medicament for treating a syndrome related to a human disease associated with the polypeptides e.g. cancer. ABU52311-ABU52408 represent the human NOVX proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Kekuda R, Tchernev VT, Liu X, Spytek KA, Patturajan M, Burg

The MIP-1, MIP-2 or analogue may be operatively linked to a carrier. The MIPs can be used to inhibit megakaryocytopoiesis to effect in vivo reduction of platelet nos. They can be used to treat disorders with excessively high platelet counts such as thrombocytosis, stroke, pulmonary embol and myeloproliferative disorders.

The invention relates to an isolated polynucleotide (I) comprising one of 245 sequences (ABQ93288-ABQ93532). Treating a condition comprising administering to a mammalian subject a composition comprising the protein (II) encoded by (I) (ABP62809-ABP63053) or an antibody (III) to (II).

(I), (II) and (III) are useful for diagnostic evaluation of disorders.

(I) is useful for gene therapy of diseases and (II) can be used for therapeutic treatment. Diseases that may be treated include wound healing and tissue repair, burns, central nervous system disorders (e.g. Alzheimer's, Parkinson's, Huntington's and amylotrophic lateral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the printed / from WIPO
